About

What is Backstage?

Backstage is an open-source software platform for building developer portals created by Spotify. At PointClickCare, we are leveraging Backstage to create a up-to-date service catalog that will centralize all the disparate sources of information available for a service. Backstage also plays a crucial role in preparing for potential service disruptions and problems, to provide basic information regarding what to expect for any potential service incident. It ensures our organization understands the consequences of downtime and has the necessary information to mitigate risks.

You should come to Backstage if you want:

- To find dependencies and relationships between various services within the PointClickCare ecosystem
- To find source code, documentation, and on-support for a service
- To understand the service infrastructure and environments at a glance
- To know who and which engineering team to reach out to about the service

Here on the side, you will find also help documentation to onboard your services onto Backstage.

Backstage Development Team

Backstage at PointClickCare is currently being developed by the Platform Engineering Team. You can find our vision and future developments for Backstage [here](#).
